I'm starting the AWS Networking Series!

Immad Khan

I'm building a cloud networking architecture

As a networking enthusiast, I recognize that the future of IT infrastructure lies in the cloud. I am learning cloud networking to align my skills with current global industry demands, with the ultimate goal of launching my career as a Cloud Network Engineer.

Cloud networking is the practice of building, managing, and securing a computer network using software and services hosted on the internet rather than relying on physical, on-premises hardware. Instead of purchasing routers, pulling cables, and configuring physical firewalls in a local data center, we rent a highly advanced, invisible infrastructure from providers like AWS or Azure. As a Cloud Network Engineer, we use web dashboards and code to instantly deploy Virtual Private Clouds (VPCs), subnets, load balancers, and virtual firewalls. Ultimately, it takes the foundational rules of traditional networking like IP addressing, routing, DNS and allows you to scale them globally in seconds using software and automation.

Excited to share my progress - build a VPC with me!

My primary goal for this AWS networking series is to transform guided labs into a professional I will set aside every week to work on this networking series. By completing these projects, I will build out my GitHub with concrete examples of VPC architecture, subnetting, and routing to prove my hands-on infrastructure skills to global startups.

What are networks?

Network is a group of two or more connected devices like computers, servers, or smartphones that communicate with each other to share data, resources, and services. These devices are linked together using physical pathways or wireless signals.

What is a VPC?

A Virtual Private Cloud (VPC) is a secure, logically isolated private network hosted within a public cloud environment that serves as the primary building block for cloud infrastructure. It functions similarly to a traditional physical data center but operates entirely virtually.
